

ABSTRACT OF THE DISCLOSURE

A method for providing voters with election information specific to voter polling location. A voter registration file is queried for a name of a registered voter in response to an input from a user. The user is queried for additional
5 information through a series of single criteria iterations each time the query renders more than one result. The user is presented with a contact with whom the user should register to vote if the user name cannot be found in the voter registration file. The user is granted access to a ballot information page if the user is found in the voter registration file. The ballot information page presents the user with relevant
10 information based on the user polling location.
